                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cc a DNA strand. The novel method comprises hybridising a target DNA strand CC containing or suspected of containing a point mutation with a test CC nucleic acid strand complementary to the DNA strand to form a target DNA strand/test nucleic acid strand plex, contacting the duplex with an CC strand/test nucleic acid strand duplex, contacting the duplex within the CC nucleotide sequence are cleaved by RNase H. The method is useful for CC detecting a point mutation in a Datarad, where the point mutation to CC detecting a single nucleotide polymorphism, preferably a CC polymorphism in a genome, e.g., a viral, bacterial, eukaryotic, mammalian CC or human genome. The method is useful to detect any nucleic acids from CC any species of organisms such as Acintobacter, Bacillus, Candida, CC enterococcus, Haemophilus, Mycobacterium and Streptococcus, and viruses. This polynucleotide sequence represents a probe relating to the mutation CC detecting method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               membrane type matrix metalloproteases; MT-MMP; neovascularisation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                vasotropic; cytostatic; potential matrix metalloprotease-2;
                                                        The invention describes the activation of potential matrix metalloprotease-2 (proMMP-2) with claudins via membrane type matrix metalloproteases (MT-MMP). Activated proMMP-2 is useful for treatment of neovascularisation and cancer. This sequence represents a potential matrix metalloprotease-2 activation associated primer. Note: This

                                                                                                                                                                                                                                   This invention relates to a novel method of identifying candidate p53 pathway modulating agent which comprises contacting an assay system comprising stearyl coenzyme A desaturase (SCD) polypeptide or nucleic acid, or their functionally active fragment or derivative, with a test agent under conditions where, but for the presence of the test agent, the system provides a reference activity. The p53 gene is mutated in over 50 different types of human cancers and is believed to be the most commonly mutated gene in human cancer. The human p53 protein normally functions as a central integrator of signals including DNA damage, hypoxia, nucleotide cytostatic activity or be useful in gene therapy. The methods of the invention are useful for identifying modulators of p53 may have the protein the strate for dientifying modulators of the p53 pathway as the proposition are useful for identifying modulators of the p53 pathway as

                                                                                                                                                                                                              target nucleic acid primer complementary to a region of the target nucleic acid, and extending the primer in the presence of a first nucleotide that is complementary to a first variant nucleotide suspected to be at a position downstream of the region and a second nucleotide that is complementary to a second variant nucleotide at the position, thus to reduce misincorporation of the first nucleotide on a template comprising the second variant nucleotide. The methods are useful for analysing molecular events for identifying individuals with mutations indicative of cancer. They are particularly useful in detecting a rare mutation in a heterogeneous biological sample (e.g. sporadic mutation in genotyping reactions (e.g. viral genotyping reactions), or detecting mutant or viral
                                                                                                                        Sequence 21
                                                                                                                                                                    reactions (e.g. viral genotyping reactions), or detecting mutant or vil sequences in pooled samples (e.g. detecting polymorphisms or inherited sequence variations in pooled patient samples). This polymucleotide sequence represents an oligo used as part of the primer extension assay

Specifically, it refers to an anti-gene strategy for gene transfer CC and transcriptional studies that comprises the transfection of a decoy CC DNA molecule i.e. a cis-element specific dspNA molecule that has been CC designed to contain a binding site for a transcription factor of conterest. In particular, this binding site comprises a novel 7-mer CC (TTTGCAT), identified as a septamer, which is present within the CC regulatory regions of some neuronal and glial specific genes. As such, CC well as therapeutic agents for blocking viral protection, tumour growth, CC apoptosis, muscle differentiation and modulating the neuronal response to CC compositions of this invention can be useful to treat CNS disorders compositions of this invention can be useful to treat CNS disorders accordingly are described as having neuroprotective activity. This cc coligonucleotide sequence is a rat nestin PCR primer of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Analysis of chemical modification of DNA involves obtaining sample of to be analyzed, treating DNA with chemical reagents that result in different base sequences, and determining sequence of resulting DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Garner HR, Minna JD,

                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC having defined 5' and 3' sequences, separated by an intermediate consequence, 2) preparing a first adapter (Ad1) of double-stranded nucleic acid (especially one strand of RNA and the other DNA), where the 5'-end CC fithe DNA strand has an overhang at least partly complementary with the 5'-end of the target, 3) preparing a second adapter (Ad2) of double con (deoxy)ribose and the second strand has a 5'-phosphate residue on (deoxy)ribose and the second strand (DNA) has a 3'-end that is at CC least partly complementary with the 3'-end of the target, the second cC strand also has a cleavage site which can generate a cleavage product that includes the complementary 3'-end of the second strand, 4) the adapters are ligated on the target, 5) reverse transcription is performed cand optionally the second strand is synthesised. The products of the capacity optionally that bind to selected targets (aptamers), potentially used for selection and preparation of nucleic acids including CC useful as therapeutic agents, e.g. as antagonists of CGRp (calcitonin CC treatment of pain, migraine and other conditions, also as starting points for trational drug design, in screening for therapeutic compounds and for carget validation. The method can be done in a single vessel, without CC sequences.
                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                with the state of methylation of one or more nucleic acids from a subject not having the cellular proliferative disorder of breast tissue. Also described are: a method for determining a predisposition to a cellular proliferative disorder of breast tissue in a subject; a method of didagnosing a cellular proliferative disorder of breast tissue in a subject; and a kit for the detecting a cellular proliferative disorder of breast tissue in a subject. The method is useful for diagnosing a cellular proliferative disorder of breast tissue in a subject. This sequence represents a primer used to sequence the cyclin 14-3-3 sigma gene during mutational analysis to examine the extent of methylation of the cyclin 14-3-3 sigma CpG islands in normal mammary epithelium, breast cancer cell lines and in primary mammary tumours.
                                                              Sequence
                                                                                                                                                                                                                                                                                    The invention describes a method of diagnosing a cellular proliferative disorder of breast tissue in a subject comprising determining the state of methylation of one or more nucleic acid isolated from the subject, where the state of methylation of one or more nucleic acids is compared
                                                                                                                                                                                                                                                                                                                                                                          Claim 12;
                                                                                                                                                                                                                                                                                                                                                                                                       subject comprises determining the state nucleic acid isolated from the subject.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      amounts or relative proportions of polynucleotide sequence or subgroups of it in polynucleotide mixture. (M1) is useful for determining variations in the amount of more than one polynucleotide sequence in a mixture with using (M1) for assessing hygienic conditions and epidemiologic situations, effects of external stimuli or treatment modalities microbial population. (M1) is useful in health care, modalities microbial population. (M1) is useful in health care, and environmental research, pharmaceutical industry and food industry, and are applicable for many other diagnostic, biotechnical and scientific purposes. (M1) provides demonstration of differences in the expression of non-homologous, allelic genes in a chromosome and may explain the reasons for different manifestation of certain diseases. (M1) allows simultaneous determination of amounts or relative proportions of more than one determination of amounts or relative proportions of more than one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of polynucleotide sequence or subgroups of it in polynucleotide mixture, by allowing hybridization reaction to take place between surplus of soluble polynucleotide probes having approximately same number of hybridizing nucleotides and resolution seabliance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining amounts or relative proportions of individual polynucleotide or subgroups in polynucleotide mixture using mixture of polynucleotide probe having approximately same length, useful in health care, food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    05-JUL-2002; 2002FI-00001325
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           04-JUL-2003; 2003WO-FI000544.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hybridizing nucleotides and resolution enabling tags, recovering quantitatively hybrids, recording amount or relative proportions of distinguishable polynucleotide probes. (M1) is useful for determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         individual target polymucleotide sequence present in polymucleotide mixture. (M1) is made very sensitive and allow quantitative detection polymucleotide sequences present in diminutive amounts. Sequences ADI34808- ADI34817 represent PCR primers used for generating probes specific for the various S. cervistae genes YAL054c-ACS1, YCR005c-CIT2 YMR083w-ADH3, YBL015w-ACH1, YFL039c-ACT1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 6; SEQ ID NO 9; 82pp; English

                                                                          CC of the polymorphism indicates the individual's risk for type 1 diabetes.

CC The human IL4 and IL13 genes are located on chromosome 5. Also described

CI is a kit for determining an individual's risk for type 1 diabetes,

CC comprising one or more sequence-specific oligonucleotide each

CC conditions to a type 1 diabetes-associated IL4 or IL13 polymorphism, and

CC individually comprising a sequence that hybridises under stringent

CC conditions to use the kit to determine the individual's risk for type 1

CC diabetes. Detection of one or more IL4 or IL13 polymorphism, and

CC diabetes. Detection of one or more IL4 or IL13 polymorphism in a nucleic

CC individual's risk for type 1 diabetes. The methods and compositions of

CC individual's risk for type 1 diabetes. The methods and compositions of

CC individual's risk for type 1 diabetes. The methods and compositions of

CC molecular biology, in particular for detecting an individual's risk for

CC ulcerative colitis, pernicious anaemia, rheumatoid arthritis, systemic

CC ulcerative colitis, pernicious anaemia, rheumatoid arthritis, systemic

CC ulcerative a probe used in the identification of human IL4 receptor

CC (IL4R) polymorphisms, which is used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  risk for type 1 diabetes. The method comprises detecting the a type 1 diabetes-associated polymorphism in the interleukin IL13 loci in a nucleic acid sample of the individual, where the IL13 loci in a nucleic acid sample of the individual, where the contraction is the contraction of the individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for determining an individual's risk for type 1 diabetes. The method comprises detecting the presence of a type 1 diabetes-associated polymorphism in the interleukin 4 (IL4) or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting an individual's risk for autoimmune type 1 diabetes, by determining sequence variapresent at the IL-4 and IL-13 loci.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 1; SEQ ID NO 18; 168pp; English

autoimmune diseases, such as multiple screening arthritis, ulcerative colitis, pernicious anaemia, rheumatoid arthritis, lupus erythematosus and inflammatory bowel disease. The present represents a probe for the wild type allele of human II4 recent which is used in the exemplification of the present invention

present invention.

The present s

systemic sequence

diabetes. Detection of one or more II4 or II13 polymorphisms in a nucleic acid sample of an individual, is useful for the determination of the individual's risk for type 1 diabetes. The methods and compositions of the present invention are also useful in the field of immunology and molecular biology, in particular for detecting an individual's risk for autoimmune diseases, such as multiple sclerosis, myasthenia gravis, ulgerative colities permicious anameter themselves, myasthenia gravis.

The human II4 and II13 genes are located on chromosome 5. Also described is a kit for determining an individual's risk for type 1 diabetes, comprising one or more sequence-specific oligonucleotide each individually comprising a sequence that hybridises under stringent conditions to a type 1 diabetes-associated II4 or II13 polymorphism, and instructions to use the kit to determine the individual's risk for type diabetes. Detection of one or more II4 or II13 polymorphisms in a nuclei

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;
ILI3 loci in a nucleic acid sample of the individual, where the presence of the polymorphism indicates the individual's risk for type 1 diabetes. The human IL4 and IL13 genes are located on chromosome 5. Also described
                                                                                         risk for type 1 diabetes. The method comprises detecting the presence a type 1 diabetes associated polymorphism in the interleukin 4 (II4) c III3 loci in a nucleic acid sample of the individual, where the preservants loci in a nucleic acid sample of the individual, where the preservants loci in a nucleic acid sample of the individual, where the preservants loci in a nucleic acid sample of the individual, where the preservants loci in a nucleic acid sample of the individual, where the preservants located acid sample of the individual, where the preservants located in the individual in the individual in the individual individual in the individual individ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      멍
                                                        The invention relates to a polypeptide involved in controlling the compression of gelatinase. The polypeptide of the invention comprises a comparise and sequence of 3 defined amino acid sequences given in the specification. Further disclosed is a DNA encoding the polypeptide. CC Methods of the invention include using the polypeptides for potentiating cc He proliferation of haematopoietic cells, in vitro proliferation of the proliferation of mammalian skin cells, treating wounds, promoting the proliferation of potentiating cc excessive expression of gelatinase in mammalian skin cells, diagnosing or treating diseases accompanying excessive expression of gelatinase in mammalian skin cells, diagnosing or controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase and antibodies are for controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase and antibodies are for controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling to the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling to the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase in mammalian skin cells or controlling the expression of gelatinase and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              06-NOV-2002; 2002JP-00322925

                                                                                     The present invention describes a mutant interleukin 10 (IL-10) or IL-6 protein which shows improved secretion in a gram-positive bacterium, where one or more proline residues within the first 10 amino acids of the mature protein have been replaced by another amino acid. Also described:
(1) a nucleic acid encoding a mutant IL-10 or IL-6 protein; and (2) an expression vector for gene expression in a gram-positive bacterium expressing the nucleic acid. The gram-positive bacterium is a lactic acid bacterium, comprising Lactococcus lactis, Lactococcus salivarius or Lactococcus acidophilus. The mutant IL-10 or IL-6 protein can be used for improving yield and facilitating downstream processing for protein purification. The present sequence represents a PCR primer used in the construction of a plasmid comprising a lactic acid bacteria codon optimised mature human IL-10, which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mutant interleukin 10; mutant IL-10; mutant IL-6; mutant interleukin 6; gram-positive bacterium; lactic acid bacterium; protein purification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mutant human

It is the anti-sense strand of a primer pair used to amplify these HIV-1, HIV-2 and SIV viral sequences, esp. in conjunction with in vitro diagnosis of in-fection. It is useful for treating viral diseases, eg. AIDS. See also AAQ06905-08 and AAQ06910-54. (Updated on 05-1405)

It corresponds to nucleotides 15 to 34 on the N-ras gene and was synthesised on an Applied Biosystems 381A DNA synthesiser. It allows the accurate determn. of changes in the N-ras gene with such efficiency and ease that large numbers of samples can be screened. See also AAQ13677-Q13689. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                This antisense oligonucleotide was designed to hybridise to the 3'-UTR (human ICAM-1 mRNA. It was synthesised in the phosphorothicate form as none of the phosphodiester form-antisense oligonucleotides which were initially tested demonstrated inhibitory activity. Oligonucleotide #15 was found to be the most active of 16 potentially inhibitory anti-sense sequences. Its anti-sense activity was not shared by other oligonucleotides which hybridise to 3'-untranslated sequences. See e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAQ66488-90 are primers which were used in the method of the invention for the detection of a mutant oncogene. The method allows the detection and measuring a mutant oncogene contained in a sputum sample. PCR is performed by utilising the mutantion position of the objective mutant oncogene as the complementary base to the 3' terminal at base of the PCR primer, and by using a mixture of three primers which are different from the hormanl sequence at the 3' terminus. Another primer is used to hold the mutant oncogene together so that the mutant oncogene can be amplified position specifically and detected. The oncogene is pref. the K-ras gene and the mutanton to be detected is pref. either codon 12, 13 or 61. This method allows detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polymerase chain reaction; primer; PCR; amplify; oncogene; K-ras; mutant;

                                                                                                  HBV core antigen (Ag) encoding sequences were subcloned and engineered sc as to be transcriptionally controlled by a vaccinia or vaccinia-like promoter. A deleted version of the core gene, referred to as core delta 8, in which 8 AAs are deleted, was used. A construct was made consisting of HBV MS antigen expressed from the modified p7.5 promoter and core delta 8 expressed from the p7.5 promoter. One primer used was AAQ67992 which hybridises from bases -230 to -211 relative to the ATG of core delta 8, upstream of the p7.5 promoter, and creases a HindIII site. A second primer (AAQ67993) hybridises to the opposite strand from bases +563 to +546 and generates a HindIII site. (Updated on 25-MAR-2003 to

The amplified sequence is preferably a sequence between nucleotides 2470 and 3346 of the consensus sequence described in AAQ71479. The method is used for the detection of Brucella infection in animals, particularly humans and cattle. This probe specifically hybridises to sequences from Brucella abortus biovar 1, Brucella abortus biovar 5, Brucella abortus biovar 5, Brucella
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cattle; disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              omp2; consensus; Brucella; identification; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR primers (AAQ91246-50) were used to amplify human glutamate receptor EAA5 genomic DNA and cDNA. Examination of the PCR products showed that the cDNA sequence differed from the genomic sequence at 2 places in the transmembrane domain-coding region, resulting in S310A and R532Q substitutions. These variations were attributed to RNA editing involving T to G and G and A substitutions. Similar RNA editing was found for EAA3 (see also AAQ91231) and EAA4 (see also AAQ91232) genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20 BP; 3 A; 4 C; 9 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 1995-240670/31.

                                                                                                                                                                gene therapy;
                                                                                                                                                                           Multiple tumour suppressor; astrocytoma; glioblastoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and a second PNA strand binds with the resulting double helix or with the first PNA strand. The PNAs possess no significant charge and are water soluble, which facilitates cellular uptake. Further, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proteases. The present sequence targets human intercellular adhesion molecule-1 (ICAM-1) 3' untranslated region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New oligomers are claimed which (A) have at least one peptide nucleic acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, coding region, 5' untranslated region of ICAM-1 or ELAM-1, or hybridisable to AUG region, coding region, 5' untranslated region of ICAM-1 region, exon/intron junction region or 3'-untranslated region of VCAM-1. The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cellular adhesion and thus as antisense-series antisenses.
                                                                       28-SEP-1995
                                                                                                                                                                                                                   P16-specific mouse MTS1E1-beta cDNA reverse primer.
                                                                                                                                                                                                                                                       07-MAY-1996
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antimetastatic agents, anticancer agents, antirhinoviral agents, anti-
AIDS agents and antiinflammatory agents. They may also be useful as
diagnostics, e.g. as probes for specific mRNAs. PNA oligomers have high
affinity for complementary single stranded DNA. They are also able to
form triple helices in which a first PNA strand binds with RNA or ssDNA.
                                                                                                     WO9525429-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim
                                                                                                                                                                                                                                                                                                                  AAQ99937
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide nucleic acid oligomers hybridising to adhesion molecule genes - are stable anti:sense cpds. of high affinity, partic. for treating inflammation, viral infection, cancer etc.

81119 is a peptide nucleic acid (PNA), which binds a target sequence. binding of the PNA prevents the transcription of the target sequence RNA polymerase. The ability of the PNA to arrest transcription makes useful in gene therapy, and in diagnostic and prophylatic methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               226

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20
                                                                                                         A probe of approximately 1 kb recognising beta-giardin genomic DNA was generated by PCR with the oligonucleotides AAQ80942 and AAQ80943. A random probe was generated as a 1.5 kb product with the primers AAQ80944 rand AAQ80945. The probes were used in the identification of cosmids from the beta-giardin genomic region in a Giardia lamblia 20-genome equivalent cosmid library. This was part of a novel method for sequence-sampled mapping of complex genomes. (Updated on 25-MAR-2003 to correct PN field.)

The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and thyroid cancers, etc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC The antisense oligonucleotide (ON) shown is a derivative of an equivalent CC wild type Human ICAM ON, in which at least one, esp. 2-10, non-terminal CC pyrimidine nucleotide(s) is/are modified. The modification may be: (a) CC replacement of a phosphodiester linkage by: a phosphoro-thicate (PS), - CC dithicate, -aramidate; borano-, alkyl-, aralkyl-phosphate; 2,2,2-CC trichloro-1,1dlmethyl-, alkyl- or aryl- phosphonate linkage; or (3'-CC thio)formacetal, methylhydroxylamine, oxime, methylenedimethylhdrazo, CC dimethylene sulphone or silyl linkage; (b) replacement of a sugar CC dimethylene by a 'morphholinonucleoside' oligomer; (c) replacement CC of beta-D-2-deoxyribose by another sugar or carbocyclic, open-chain or CC bicyclic sugar analogue; or (c) replacement of the natural nucleoside by an analogue, e.g. 5-hydroxymmethyl-uridine. The 5' and/or 3' CC dise by an analogue, e.g. 5-hydroxymmethyl-uridine. The 5' and/or 3' CC modifications increase nuclease resistance and thus improve stability and crivity
                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T4133-6 amplify clone pm0258 which comprises the GS HWMGS000995 (T19995). This amplification reaction gave a prod. indistinguisable from the same PCR using mouse or Chinese hamster ovary DNA as a template
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single-stranded DNA for identifying gene signatures - isolate directed human cDNA library that reflects relative abundance mRNA in specific human tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 1995-206931/27

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A sense oligonucleotide S50 (AAQ99516) corresp. to nucleotides 50-69 in the human Fas ligand coding sequence given in AAT03498 was synthesised with phosphorothicate linkages. The complementary, antisense oligonucleotide A69 (AAQ99517) was also synthesised. The effects on Fas ligand-mediated apoptosis of A69 and S50 were analysed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide which binds to Fas antigen, and antibody reactive treatment and diagnosis of viral or auto:immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fas ligand; Tumour Necrosis factor family; apoptosis; cell death; Fas cell surface antigen; human; Fas-L; phosphorothicate; sense oligonucleotide; inhibition; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence 20 BP; 2 A; 5 C; 8 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                AAT44425-54 are antisense oligonucleotides which have at least one azapurine base. The presence of an 8-azapurine base results in significantly stronger complexing when hybridising to target nuclei acids. The present sequence is against the intracellular adhesion molecule (ICAM) gene

A cap sequence increases nuclease resistance of the oligonucleotide and also increases cell penetration. The present sequence is that of a preferred oligonucleotide, directed against an intercellular adhesion molecule

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents an inhibitor of ICAM, and is an example of an oligonucleotide analogue of the invention. The oligonucleotide analogues of the invention are used as inhibitors of gene expression (antisense of igonucleotides, ribozymes, sense oligonucleotides and triplex-forming oligonucleotides), as probes for the detection of nucleic acids, and as auxiliaries in molecular biology. As gene expression inhibitors they may be used for treating viral infections (especially where the virus is HSV-1, HSV-2, an influenza virus, VSV, hepatitis B or papilloma virus), cancer, restenosis, medical conditions mediated by integrins or cell-cell achesion receptors, and medical conditions induced by growth factors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New phosphono:mono:ester oligo:nucleotide analogues - inhibitors of gene expression for treating viral infections, cancer, restanceis etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure;

The FI Min/Immortomouse and conditionally immortalised cell lines derived from this mouse, carrying the Multiple Intestinal Neoplasia (Min) gene, which predisposes to colon cancer, and a temperature sensitive mutant of the SV40 large T gene which allows growth at certain temperatures, are useful in studies of aberrations of growth and differentiation, including carcinogenesis that may be induced, e.g. by viruses, various genes or mutagens. PCR analysis was carried out to detect the presence of the SV40 large T gene and the Min mutant allele. Mouse DNA was prepd. from tail large T gene and the Min mutant allele. Mouse DNA was prepd. from tail large of mice greater than 2 weeks of age. AAT15586-87 which were used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primer for Min mutant allele 280 bp PCR product amplification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAT30227
                                                       AAT30211-T30233, AAT33058-T33112 and AAT36667-T36684 represent antisense oligonucleotides of the invention. These sequences target regions of the coding sequences for human intercellular adhesion molecule-1 (ICAM-1), endothelial leukocyte adhesion molecule-1 (ELAM-1, also known as E-selectin), or vascular cell adhesion molecule-1 (VCAM-1). This sequence targets the 3' untranslated region (nucleotides 1952-1971) of ICAM-1. ICAM-1, ELAM-1, and VCAM-1 represent three of the five cell adhesion molecules involved in the adherence of white blood cells to vascular endothelium. These sequences can be used in a composition for treating allograft rejection. The composition contains one of these sequences in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-MAY-1996
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WO9615780-A1
combination with an immunosuppressive agent. The immunosuppressive agent used in the compositions is brequinar, rapamycin, anti-lymphocyte serum, a monoclonal antibody against LFA-1 or an antisense oligonucleotide. The

                                                                                                            This invention describes novel phosphonomonoester oligonucleotide analogues which act as inhibitors of gene expression (as sense/antisense, ribozyme or triplex-forming molecules), useful as diagnostic agents (i.e. probes for detecting nucleic acid) or for treatment of diseases caused by viruses, influenced by integrins or cell-cell adhesion receptors, induced by factors such as TNF-alpha, or cancer or restensis. The products of the invention satisfy the requirements of good in-vivo stability, ability to cross cellular and nuclear membranes, and specific binding to target nucleic acid better than known oligonucleotides
                                                                                                                                                                                                                                                                New oligo:nucleotide analogues contg. phospho:mono:ester bridges -therapeutic inhibition of gene expression, e.g. in cancer or viral infection, with good specificity and in vivo stability.
                                                                                                                                                                                                                                            Disclosure; Page 23; 36pp; German.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Phosphonomonoester analogue; inhibitor, ribozyme; diagnostic agent; detection; integrin; cell-cell adhesion receptor;

By using these compositions, allograft survival times are extended, and donor-specific transplant tolerance is induced
                                                                                                                                                                                                                                                                                                                       1996-425893/43.

                                                                                                                                                                                                                                         AAT27481-T27507 are human c-raf kinase antisense oligonucleotides used for the inhibition of raf expression. The oligonucleotides (ONS) are targeted to either coding region, start or stop signals or 5' or 3' untranslated region (UTR) mRNA encoding human c-raf. The ONS may be phosphorothicate linked and may contain modifications at the 2' position of the sugar moiety. ONs are pref. complementary to either 3' or 5' UTRs, phosphorothicate linked and contain 2'-O-alkyl sugar modifications. The ONS are used to inhibit expression of human raf in partic. in conditions associated with hyperproliferation e.g. cancer, restenosis, and psoriasis

Hybridisation causes inhibition of expression of the multidrug resistance phenotype by the cell, due to the oligonucleotide having an aptameric inhibitory effect as well as an antisense inhibitory effect. The oligonucleotide is administered to cancer patients to prevent development of the multidrug resistant phenotype. When co- administered with chemotherapeutic agents, the oligonucleotide is useful for potentiating elimination of multidrug resistant tumour cells from bone marrow or peripheral stem cell grafts. Also, the oligonucleotide can be used as an immunosuppressive agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligo-nucleotide(s) able to inhibit multi:drug resistant phenotype -either by anti:sense or aptameric effects, useful for enhancing cytotoxic effects of chemotherapeutic agents on multi:drug resistant cancer cells.
                                                                                                                                                                                                                                                                                                                                        18-MAR-1994;

                                                                                                                                                                                         The oligonucleotides AAT98010-T98059 are useful as primers for nucleic acid amplification of conserved sequences of the gag, vpr. pol or vpu genes of the HIV-1 strains Bru, Mal, Bli, HIV-2 ROD or simian immunodeficiency virus (SIV) MAC or the nef2, vif2 or vpx genes of HIV-2 ROD and SIV MAC. This primer is targetted to sequences in the gag gene of the viral strains. The sequence are therefore used to detect HIV-1, HIV-2 or SIV infections. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                            CC AAT47375-T47409 represent amplification primers for the cystic fibrosis CC transmembrane regulator (CFTR) gene. These sequences can be used as half CC of the chimeric primer of the invention. The primers are used for CC amplification of a target DNA sequence, and can be used in a multiplex CC pCR amplification. The primers have the sequence 5'-XY-3', where X is a CC sequence that does not hybridise to the target sequence (such as AAT47344 CCC -T47374), and Y is a sequence contained within or flanking the target CC sequence (such as this sequence). During early cycles of amplification, CC products are synthesised that contain the chimeric primers on either end. CC The primers then serve as high stringency recognition sequences for CC subsequent rounds of amplification. As a result, the annealing efficiency of different primers and their targets in a multiplex amplification of CC certain targets. The chimeric primer comprise a 5' universal domain and a 3' target-specific domain. They are used for the simultaneous PCR CC amplification of multiple DNA targets in a sample. The primer containing CC detecting the presence of multiple defined targets e.g. to detect containing sense like the CFTR, the Wilms Tumour, and the beta-xxx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                 homologue of multidrug resistance-associated protein. The nucleic acids are used to provide cells with cMOAT protein activity. cMOAT protein activity in cells can be enhanced by increasing the level of glucathione, glucuronide and/or sulphate. Antisense constructs, especially derived from another multidrug resistance (MDR) related protein, e.g. MDR-1, to the nucleic acids and vectors can be used to decrease the level of cMOAT in a cell. The nucleic acids and proteins can be used especially in diagnosis of Dubin-Johnson disease, Rotor disease or another disease involving cMOAT. The cMOAT gene may also be used as a selectable marker gene. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR primers AAT94038-39 were used to amplify a 241 bpo fragment of canalicular multispecific organic anion transporter (cMOAT) protein cDNA. The PCR product was cloned, and subsequently used in a RNAse protection assay. CMOAT is a new member of the ATP-binding cassette (ABC) transporter family. The ATP dependent cMOAT transporter system mediates hepatobiliary excretion in the liver. cMOAT may be a liver-specific hepatobiliary excretion in the liver. cMOAT may be a liver-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              25-MAR-2003

                                                                                                                                                                                                                                                                                                                           This is the nucleotide sequence of a PCR primer used for amplification in the method of the invention involving the use of the multiple tumour suppressor (MTS) gene, to diagnose and treat cancer. The MTS gene is useful in the diagnosis and prognosis of human cancer. The MTS gene is sequences are those that are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used for recombinant production of MTS. Recombinant MTS can be used to screen for drugs to be used for cancer therapy, and the protein itself may also be used to restore MTS function in a scall
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Multiple tumour suppressor; MTS; human; cancer; hybridisation; somatic mutation; gene therapy; PCR; primer; amplification; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids based on multiple tumour suppressor, MTS, sequences - useful as hybridisation probes, primers and recombinant production of in the diagnosis and treatment of cancers related to MTS mutation(s).

The method is for treating a subject having, or at risk of having an acute decrement in air flow, comprising administering a nucleic acid sequence containing at least one unmethylated CpG. The nucleic acids containing an unmethylated CpG dinucleotide affect an immune response in a subject by activating natural killer cells (NK) or redirecting a subject s immune response from a Th2 to a Th1 response by inducing monocytic and other cells to produce Th1 immunologic component, such as asthma or environmentally induced airway disease. They can also be used to treat pulmonary diseases with Grampositive bacterial infections or endotoxaemia including bacterial positive bacterial sepsis, cystic fibrosis, inflammatory bowel disease and liver cirrbesis Crampositive comparations or endotoxaemia including bacterial and other cirrbesis crampositive comparations or endotoxaemia including bacterial and liver cirrbesis crampositive comparations or endotoxaemia including bacterial and liver cirrbesis crampositive comparations or endotoxaemia including bacterial and liver cirrbesis crampositive comparations or endotoxaemia including bacterial and liver cirrbesis crampositive comparations or endotoxaemia including bacterial and liver cirrbesis crampositive comparations or endotoxaemia including bacterial and liver cirrbesis crampositive bacterial comparations or endotoxaemia including bacterial crampositive bacterial crampositive comparations or endotoxaemia including bacterial crampositive bacterial crampositive comparations or endotoxaemia including bacterial crampositive comparations or endotoxaemia crampositive compar
